

TS-1

IN-BAIL TEAT SPRAYER ROTARY SHEDS

LOOKING FOR AN IN-BAIL TEAT SPRAYER?

Designed specifically for rotary platforms, the MilktechNZ® TS-1 is an automatic in-bail, post teat spraying system. The TS-1 sprays the teats from underneath the animal and immediately after the milking process. This provides better coverage than traditional 'from behind' teat sprayer systems leading to improved udder health.

The MilktechNZ® TS-1 leg spreader bolts to any platform surface (concrete, steel or composite) with no glues. This means it can be fitted between milkings without the need for long curing times or dry, clean surface prior to installation.

- Made from chemically resistant materials to suit all teat spray types.
- Immediate protection of the teat, ensuring excellent animal health.
- Control timing and teat spray volumes through your smart device.
- Designed with the lowest possible profile to suit different udder heights and cluster positions during milking.
- The teat spray chemical is isolated from the solenoid and pump mechanism so regular purging and cleaning with water is not required.
- Reduces labour and avoids operator errors.
- 100% designed and manufactured in New Zealand.
